

# LEAD SCORE CASE STUDY

## Problem Statement :

X Education sells online courses to industry professionals. The company markets its courses on several websites and search engines like Google.

Once these people land on the website, they might browse the courses or fill up a form for the course or watch some videos. When these people fill up a form providing their email address or phone number, they are classified to be a lead. Moreover, the company also gets leads through past referrals.

Once these leads are acquired, employees from the sales team start making calls, writing emails, etc. Through this process, some of the leads get converted while most do not. The typical lead conversion rate at X education is around 30%.

## Business Goal:

X Education needs help in selecting the most promising leads, i.e. the leads that are most likely to convert into paying customers.

The company needs a model wherein you a lead score is assigned to each of the leads such that the customers with higher lead score have a higher conversion chance and the customers with lower lead score have a lower conversion chance.

The CEO, in particular, has given a ballpark of the target lead conversion rate to be around 80%

## Strategy :

1. Source the data for analysis Clean and prepare the data Exploratory Data Analysis.
2. Feature Scaling
3. Splitting the data into Test and Train dataset.
4. Building a logistic Regression model and calculate Lead Score.
5. Evaluating the model by using different metrics - Specificity and Sensitivity or Precision and Recall. Applying the best model in Test data based on the Sensitivity and Specificity Metrics.

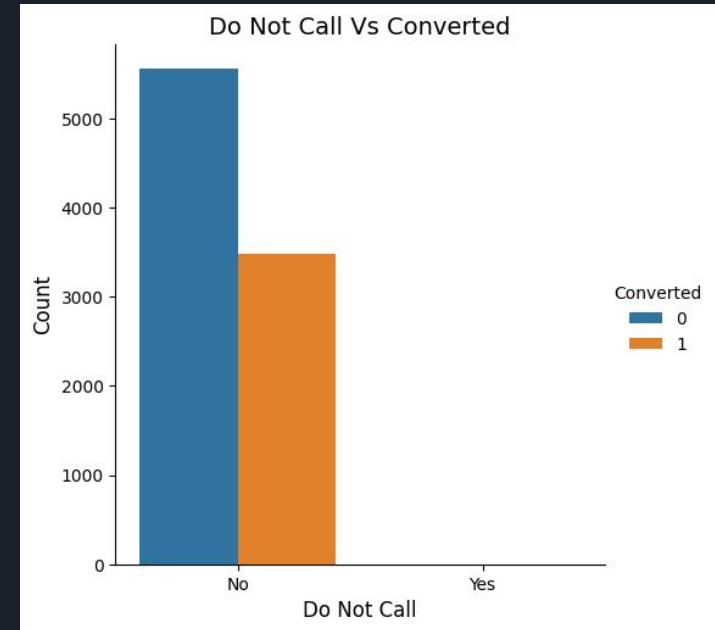

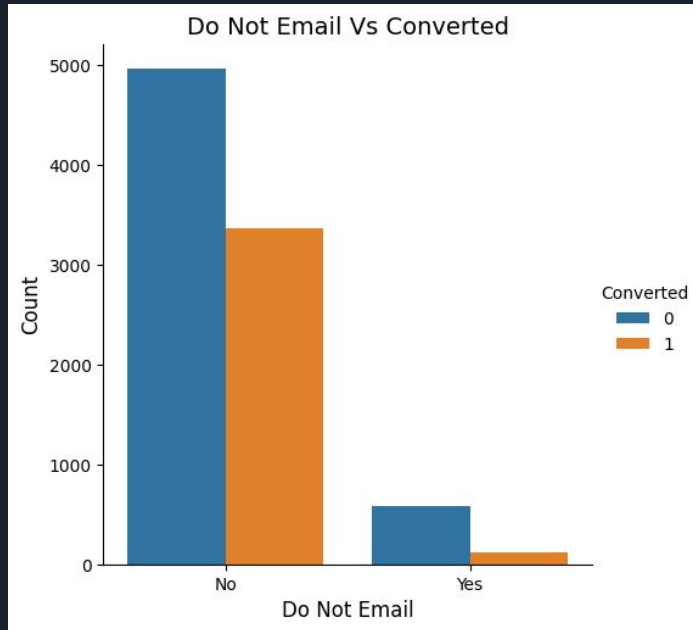

# Data Analysis

We have 39% conversion rate

Major conversion is from google

Major conversion has happened from Emails sent and Calls made Submission

Major conversion through landing page submission

Major conversion through sms sent

# Variables Impacting the Conversion Rate

- Do Not Email
- Total Visits
- Total Time Spent On Website
- Lead Origin – Lead Page Submission
- Lead Origin – Lead Add Form
- Lead Source - Olark Chat
- Last Source – Welingak Website
- Last Activity – Email Bounced
- Last Activity – Not Sure
- Last Activity – Olark Chat Conversation
- Last Activity – SMS Sent
- Current Occupation – No Information
- Current Occupation – Working Professional
- Last Notable Activity – Had a Phone Conversation
- Last Notable Activity - Unreachable

# Conclusion

While we have checked both Sensitivity-Specificity as well as Precision and Recall Metrics, we have considered the optimal cut off based on Sensitivity and Specificity for calculating the final prediction. –

Accuracy, Sensitivity and Specificity values of test set are around 81%, 79% and 82% which are approximately closer to the respective values calculated using trained set.

Also the lead score calculated shows the conversion rate on the final predicted model is around 80% (in train set) and 79% in test set

The top 3 variables that contribute for lead getting converted in the model are Total time spent on website

Lead Add Form from Lead Origin

Had a Phone Conversation from Last Notable Activity

Hence overall this model seems to be good.
